PLACE: BENGALURU

DATE: 21 APRIL 2026

ACKNOWLEDGEMENT

For completing this project work, we have received the support and the guidance from many people whom I would like to mention with deep sense of gratitude and indebtedness. We extend our gratitude to our beloved **Chancellor, Pro-Vice Chancellor, and Registrar** for their support and encouragement in completion of the project.

I would like to sincerely thank my internal guide **Ms. Delsy Jyothi, Assistant Professor,** Presidency School of Computer Science and Engineering, Presidency University, for her moral support, motivation, timely guidance and encouragement provided to us during the period of our project work.

I am also thankful to **Dr. Blessed Prince P, Professor, Head of the Department, Presidency School of Computer Science and Engineering** Presidency University, for his mentorship and encouragement.

We express our cordial thanks to **Dr. N Duraipandian**, Dean PSCS & PSIS, Presidency School of computer Science and Engineering and the Management of Presidency University for providing the required facilities and intellectually stimulating environment that aided in the completion of my project work.

We are grateful to **Dr. Sampath A K, PSCS** Project Coordinators**, Mr. Muthuraju V, Program Project Coordinator**, Presidency School of Computer Science and Engineering, or facilitating problem statements, coordinating reviews, monitoring progress, and providing their valuable support and guidance.

We are also grateful to Teaching and Non-Teaching staff of Presidency School of Computer Science and Engineering and also staff from other departments who have extended their valuable help and cooperation.

Abstract

The information management of travel in the contemporary world has become more multifaceted than ever because of the fast development of tourism and the popularity of online booking and navigational tools. The travelers also have serious problems with planning of their tour, transport documentation, reservation confirmation, costs, and emergency information, because they are most likely to be distributed through emails, messaging systems, screenshots, and various mobile devices. A poor arrangement of travel data may result in lost time, inadequate spending, security, and a high level of stress during traveling, particularly in distant destinations where there is low internet connectivity. The issue is also aggravated by the absence of a standardized platform, which offers organized trip planning, real-time support, and offline access, which leads to inefficient traveling experiences.

The proposal will provide solutions to these challenges by means of developing a mobile based Smart Travel Companion Application named JourneyBox, which will combine the information capture, organizing and supporting of a trip on a single Android platform. The application uses mobile technologies, cloud storage, and the location-based services to enable the user to provide trips, daily itineraries, save key travel documents, and track their spending in a structured way. The system also has map-based navigation support, reminder alerts and emergency guidance options to guide the user in their travels. Interactive interfaces are integrated as well as simplified input mechanisms to make it more user-friendly and easier to use.

In order to enhance the efficiency of travels and user involvement, the application will be able to facilitate offline data on crucial information during travels, which will be reliable even when there is low network. There is also the provision of ability of users to track their travel costs as well as to have the knowledge of their spending habits to help in the financial planning. Convenience, safety, and organization are the principles of the offered solution that will make all information about trips organized in one mobile application. A general overview of the system shows that the app is technically feasible based on existing mobile development frameworks, cloud services, and geolocation APIs and only requires a small amount of hardware.
